

ABSTRACT OF THE DISCLOSURE

A structure and method of arrangement for use in audio playback that includes a pair of speakers each having a housing and fasteners, which may cooperate to provide a convex configuration. The fasteners include two spring biased fasteners that are configured to retract simultaneously in each of the housings. Once they are retracted simultaneously, the housings may be twisted relative to each other to lock the speakers together through engagement of two fixed fasteners and through spring bias from the two spring biased fasteners. An audio cord or wire of the speakers may then be spooled about a junction formed where the fixed fasteners overlap each other to effect the engagement.
